

**SW n° 06 of Mechanic**  
**Work and Energy**

**Exercise 1**

A particle of mass  $m$ , initially at rest in A, slides without friction on the circular surface AOB of radius  $a$ .

- 1) Determine the work of weight from A to M.
- 2) Determine the work of the surface-particle contact force  $m$ .
- 3) Determine the potential energy  $E_p$  of  $m$  at the point M ( $E_p(B) = 0$ ).
- 4) Use the kinetic energy theorem to determine the speed of  $m$  at point M, deduce its kinetic energy  $E_c$ .
- 5) Calculate the mechanical energy  $E_m$ .
- 6) Show  $E_c$ ,  $E_p$  and  $E_m$  ( $0 < \theta < \pi/2$ ). Discuss.
- 7) The circular surface AOB is connected to a horizontal part BC, there is friction between B and C, the particle stops at a distance  $d$  from B. Determine the coefficient of kinetic friction. Given  $d = 3a = 3m$ .

**Exercise 2**

Consider a small block of mass  $m = 5\text{kg}$  dropped without initial velocity at point A of an inclined plane at an angle  $\alpha = 30^\circ$  to the horizontal. Point A is at a height  $h_0 = 5\text{m}$  from the horizontal.

1- Knowing that the coefficient of dynamic friction on plane AB is  $\mu_d = 0.2$ , applying the fundamental principle of dynamics:

- What is the nature of the motion on plane AB?
- Calculate the speed of the block when it reaches point B.

2- After passing through point B at speed  $V_B$ , the mass arrives at point C. Knowing that the coefficient of friction is negligible on plane BC :

- Deduce the speed at point C?
- Calculate the maximum compression of the spring, given a stiffness constant equal to  $k = 100\text{N/m}$ ? ( $g = 10\text{ m/s}^2$ ).

**Exercise 3**

A piece of ice M of mass  $m$  slides without friction over the outer surface of an igloo, which is a half-sphere of radius  $r$  with a horizontal base.

At  $t=0$ , it is released from point A without any initial velocity.

- Find the expression for the velocity at point B, as a function of  $g$ ,  $r$  and  $\theta$ .
- Using the fundamental relation of dynamics, determine

the expression of  $|\vec{N}|$  the reaction of the igloo on M at point B as a function of velocity  $v_B$ .

- At what height does M leave the sphere?
- At what speed does M arrive at the axis (Ox)?
